Room/Event Management Integration

Intelligent Door Control and Temporary Access Management

Safer, More Efficient Campuses

- **Eliminate manual programming:** Rooms unlock using real-time information from your existing room scheduling system(s)

- **Security-focused:** Your access control system can override DAX at any time

- **Handle unplanned scenarios:** Predictably handle a wide range of scenarios, including weather delays, lockdown, etc.

- **Intelligent access assignment:** Assign temporary access to individuals for spaces that shouldn't unlock (study rooms, music studios, and more.)
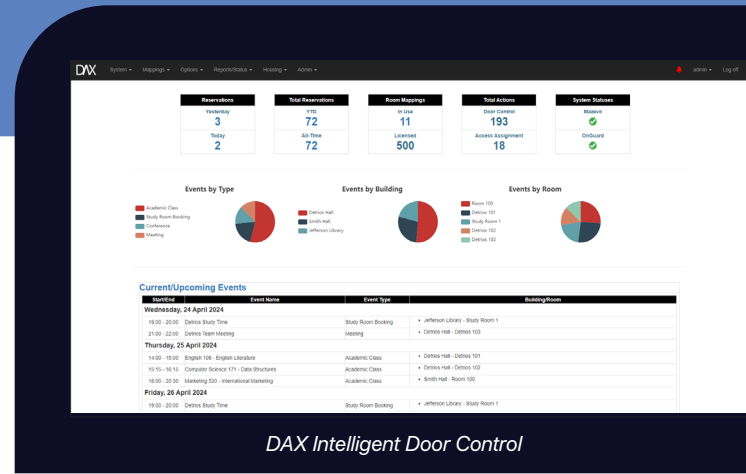

Real-time Event Management & Access Control Integration

As the industry's only off-the-shelf solution that integrates your existing access control and room scheduling/event management systems, DAX automates unlocking and securing readers and doors on campus using actual event schedules, while always working within your configured security policies.

DAX eliminates the need to run daily or weekly event reports, freeing administrators from the thousands of hours spent annually programming and maintaining custom door unlock schedules. The solution allows you to configure a wide range of options that bring additional convenience and efficiency, without compromising security.

DAX adds more configuration capabilities-including additional pre-event and post-event unlock times, handling standard building open hours, and the ability to go hands-off during unplanned events like weather delays, lockdown or shelter in place scenarios, and room maintenance. And, because DAX talks to your event management system in real-time, last-minute events or cancellations are no problem!

DAX is a certified partner solution that leverages manufacturer-supported APIs and utilizes best practices to ensure you maintain full support across each critical campus system integrated with DAX.

DAX Intelligent Door Control

35+ universities using DAX

10K+ rooms under management

700,000+ students and staff safeguarded

2 Million+ annual events and classes secured

Join the dozens of colleges and universities around the country that are already saving thousands of hours every year with DAX, Detrios' game-changing access control solution.

Say goodbye to manual programming and hello to a safer, more secure campus with DAX!

Housing Access Automation

DAX Intelligent Access Management

## Safer, More Efficient Campuses

- **Eliminate Manual Programming:** Automates all aspects of card access assignment, removal, and updates using housing contract data

- **Automated Room Swap Access:** Allows you to configure overlapping access assignments for room changes to allow students to move to their new room

- **Powerful Access Rules Engine:** Enables access to be assigned based on room, suite, floor, building, and/or area using the powerful yet intuitive automatic access mapping feature

- **Efficient Pre-Assignment:** Access can be assigned in advance and enabled upon check-in, reducing strain on the access control system and providing visibility prior to move-in day

Housing Access Automation

Detrios' DAX Intelligent Housing Access Management software provides seamless integration between your existing housing management platform and your access control system, automating the assignment and management of card access for students using housing contract data in near-real-time.

DAX allows you to configure your housing access using its powerful and intuitive rules engine to drive access by building, floor, suite, room, and more. The solution will assign access at whatever level you have electronic access control for each residential hall. It can even automate difficult and time-consuming multi-step manual processes, such as managing overlapping-room access for room changes, giving a student access to both rooms automatically for a configurable period of time so they can move.

DAX also supports all of the standard housing access management features you would expect, including early check-ins, late check-outs, cancellations, etc. Also, DAX talks to your housing management and access control systems using manufacturer-supported APIs to ensure a robust, scalable, and supported integration.
